

# 2013 Renewable Energy Data Book

## Acknowledgments

This report was produced by Sean Esterly and Rachel Gelman, edited by Karin Haas, and designed by Stacy Buchanan and Alfred Hicks of the U.S. Department of Energy's National Renewable Energy Laboratory (NREL). We greatly appreciate the input, review, and support of Ookie Ma, Steve Capanna, Fred Joseck, Hoyt Battey, Douglas Hollett, Minh Le, Jay Nathwani, Tien Nguyen, Christopher Richard, Valerie Reed, and Logan Putnam of DOE, as well as Doug Arent, Austin Brown, Jacquelin Cochran, Paul Denholm, David Feldman, Bryan Hannegan, Jeff Logan, Maggie Mann, David Mooney, Robin Newmark, Michael Pacheco, Gian Porro, Paul Schwabe, and Keith Wipke of NREL.

The primary data represented and synthesized in the *2013 Renewable Energy Data Book* come from the publicly available data sources identified on page 124.

# Key Findings

- **United States overall energy consumption** grew to 97.3 quadrillion Btu in 2013, a **2.4% increase** from 2012. Energy consumption from coal and renewables grew slightly, while consumption from petroleum and natural gas fell slightly.
- United States **electric power sector energy consumption** grew to 38.4 quadrillion Btu in 2013, a **0.6% increase** from 2012.\*
- **Renewable electricity\*\* grew to nearly 15% of total installed capacity and 13% of total electricity generation in the United States** in 2013. Installed renewable electricity capacity exceeded 171 gigawatts (GW) in 2013, generating 534 TWh.
- In 2013 in the United States, solar electricity was the fastest growing electricity generation technology, with **cumulative installed capacity increasing by nearly 66% from the previous year.**
- In the United States, **wind electricity generation increased 20% in 2013**, while wind electricity capacity grew 1.8%.

\*Source: Energy Information Administration (EIA); full references are provided beginning on page 125.

\*\*Unless noted, renewable electricity includes hydropower and biopower

## Key Findings (continued)

- In the United States, renewable electricity has been capturing a growing percentage of new capacity additions during the past few years. **In 2013, renewable electricity accounted for more than 61% of all new electricity capacity installations** in the United States. By comparison, renewable electricity captured 4% of new capacity additions in 2004 and 57% in 2008.\*
- The installed **global renewable electricity\* capacity more than doubled between 2000 and 2013**, and comprises 27% of the total electricity capacity globally, representing a significant and growing portion of the total energy supply.
- Worldwide, solar photovoltaics (PV) and concentrated solar power (CSP) are among the fastest growing renewable electricity technologies—**between 2000 and 2013, solar electricity generation worldwide increased by a factor of nearly 68.**
- Biodiesel was the fastest growing biofuel type, with production increasing by 64% in the United States and 17% globally, from a relatively small base.

## I. U.S. Energy Background Information

# U.S. Energy Production and Consumption (2013)

## U.S. Energy Production (2013): 81.8 Quadrillion Btu

## U.S. Renewable Energy Production: 9.2 Quadrillion Btu

## U.S. Energy Consumption (2013): 97.3 Quadrillion Btu

## U.S. Renewable Energy Consumption: 9.2 Quadrillion Btu

Source: EIA

The difference in the amount of energy consumed and produced is made up by net imports. All data are reported as primary energy.

\*Solar PV data provided includes only on-grid systems of 1 MW or higher in capacity. Grid-connected distributed capacity and associated generation of 1 MW or less, a rapidly growing market segment, is included in subsequent figures in later sections.

# U.S. Energy Consumption by Sector (2013)

U.S. Energy Consumption, 2013: 97.4 Quadrillion Btu

U.S. buildings  
represent 40.1% of  
total energy use.

# U.S. Energy Consumption – Residential and Commercial (2013)

I

## 2013 Residential Energy Consumption

21.1 Quadrillion Btu

## 2013 Commercial Energy Consumption

17.9 Quadrillion Btu

Source: EIA

\*While coal is a small direct contributor to residential and commercial energy consumption, coal is a major fuel for electricity generation and therefore contributes to electricity retail sales and electrical system energy losses.

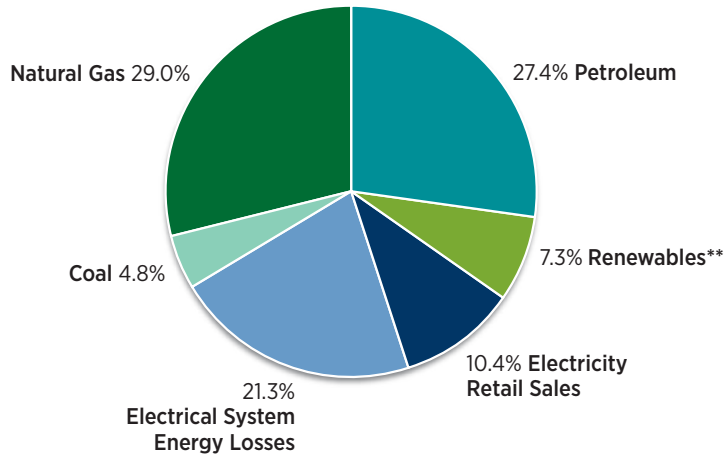

\*\*The direct renewables contribution consists primarily of wood and wood-derived fuels, municipal solid waste, solar thermal direct-use energy and PV electricity net generation, and geothermal heat pump and direct-use energy.

# U.S. Energy Consumption – Industry and Transportation (2013)

### 2013 Industrial Energy Consumption

31.4 Quadrillion Btu

### 2013 Transportation Energy Consumption

27.0 Quadrillion Btu

Source: EIA

\*More than 95% of natural gas use powers natural gas pipeline compressors

\*\*For industrial consumption, the direct renewables contribution consists primarily of wood and wood-derived fuels, municipal solid waste, and conventional hydropower.

\*\*\*For transportation consumption, the direct renewables contribution consists primarily of fuel ethanol and biodiesel.

## II. Renewable Electricity in the United States

# Renewable Electricity in the United States: Summary

- Since 2000, cumulative renewable electricity\* installations in the United States have nearly doubled, and in 2013 they represented **171 GW of installed U.S. capacity**. Every renewable electricity technology added capacity in 2013, with overall renewable electricity capacity increasing 4.6%.
- Installed renewable electricity capacity has grown at a compound annual growth rate (CAGR) of **4.8% per year from 2000 to 2013**.
- U.S. renewable electricity in 2013 was 14.8% of total overall installed electricity capacity and **13.1% of total annual generation in the United States**.
- Overall renewable generation increased 6.1% in 2013, with generation from geothermal and hydropower dropping slightly.
- Over the timeframe of 2008 to 2013, the United States' **total renewable electricity generation increased by 40%**, while non-hydro renewable electricity generation more than doubled.

- In 2013, solar PV and CSP were the fastest growing renewable electricity technologies, with **cumulative installed PV capacity increasing by nearly 65% (7.3 GW to 12.0 GW) and CSP capacity increasing by 81% (0.5 GW to 0.9 GW)**. Solar PV accounted for about 63% of U.S. renewable electricity installed in 2013.
- Cumulative installed wind capacity increased only 1.8% in 2013, much lower than the increases in previous years. However, wind generation increased by nearly 20%, reflecting new generation from capacity installed in 2012.
- Electricity capacities of biomass, geothermal, and hydropower have remained relatively stable from 2000 to 2013, experiencing a combined increase in capacity of 9% over the timeframe.
- In 2013, **hydropower produced 50% of total renewable electricity generation, wind produced 31%, biomass produced about 11%, solar (PV and CSP) produced 4%, and geothermal produced 3%**.

# U.S. Capacity and Generation: All Renewables

	Total Nameplate Capacity (MW)	Total Generation (GWh)
2000	93,370	356,789
2001	94,943	288,009

# State Renewable Energy Information: Summary

- In 2013, **California had the most installed renewable electricity capacity** of any U.S. state (26.0 GW), and also had the most grid-connected solar PV capacity (5.1 GW).
- In 2013, **Washington had the most installed renewable electricity capacity per capita**, followed by Montana, North Dakota, Oregon, and Wyoming.
- California installed nearly 2.6 GW of solar and 0.3 GW of wind capacity in 2013, the most of any state.
- **Texas** continued in 2013 as the state with the **most installed wind capacity**, with **12.3 GW**.
- A combination of **state renewable portfolio standards and state and federal incentives** for renewable electricity and renewable resource development continues to contribute to growth of renewable generation in many states.\*

\*Although the federal production tax credit (PTC) expired on December 31, 2013, its last extension included an adjustment of eligibility criteria that is expected to result in the qualification of renewable generation projects that began construction in 2013 and maintain construction into 2014 and 2015. The solar component of the federal investment tax credit (ITC) is scheduled to be reduced from 30% to 10% beginning in 2017 (Source: Lantz et al. 2014).

### III. Global Renewable Energy Development

# Global Renewable Energy Development: Summary

- Cumulative global renewable electricity **installed capacity grew by 108%** from 2000 to 2013 (from 748 GW to 1,560 GW).
- Renewable sources accounted for **23% of all electricity generation worldwide** (5,095 TWh) in 2013.
- Wind and solar electricity have been the fastest growing renewable electricity technologies worldwide. **Wind electricity generation grew by a factor of 18 and solar electricity generation grew by a factor of 68** between 2000 and 2013.
- In 2013, China led the world in cumulative total renewable electricity installed capacity, as well as cumulative wind and hydropower capacity. Germany led the world in cumulative PV installed capacity. The United States led the world in geothermal and biomass installed capacity.

#### IV. Wind

# Wind: Summary

- In the United States, wind electricity experienced limited growth, with only 1.1 GW of new capacity added, a 92% reduction from the record-setting 13.1 GW installed in 2012. This drop can be attributed largely to a late extension of and modified eligibility requirements for the federal production tax credit (PTC).\*
- At the end of 2013, there was more U.S. wind power capacity under construction than at any time previously: construction activity was started on more than 10.9 GW during the fourth quarter, resulting in a total pipeline of 12.0 GW of projects under construction.\*\*
- **China continued in 2013 to lead the world in cumulative installed wind capacity**, with more than 91 GW installed as of the end of 2013.
- **Global cumulative installed offshore wind capacity surpassed 7 GW** in 2013. While projects have been proposed, no commercial offshore wind turbines have yet been commissioned in the United States.

\*Source: LBNL

\*\*Source: American Wind Energy Association (AWEA). Although the federal production tax credit (PTC) expired on December 31, 2013, its last extension included an adjustment of eligibility criteria that is expected to result in the qualification of wind projects that began construction in 2013 and maintain construction into 2014 and 2015.

V. Solar

# Solar: Summary

- Solar electricity generating capacity **grew by a factor of 35 between 2000 and 2013** and currently accounts for 0.5% of annual U.S. electricity generation. PV cumulative capacity increased 65% in 2013 alone.\*
- Countries with extensive solar policies—such as Germany and Spain—lead the world in solar PV and CSP deployment, respectively. Similarly, **U.S. states with extensive solar incentives led the United States in both cumulative and annual installations in 2013** (California, Arizona, New Jersey, North Carolina, and Massachusetts).\*\*
- U.S. manufacturers currently have a small share of the worldwide PV market (2%). **Asian—particularly Chinese—manufacturers lead the market with 86% of the global photovoltaic module production.**
- **410 MW of new CSP capacity came online in the United States in 2013**, an increase in cumulative capacity of 81%. Approximately 400-500 MW of CSP capacity is currently under construction and expected to come online in 2014 and 2015, while another 3,600 MW is under development.\*\*\*

\*Approximately 39% (1,874 MW) of the solar PV installed in 2013 was grid-connected distributed capacity (Source: Larry Sherwood/IREC).

## VI. Geothermal

# Geothermal: Summary

- **The United States leads the world in installed geothermal electricity capacity and generation**, with most of that capacity installed in California, followed by Nevada.
- U.S. geothermal electricity capacity has remained relatively stable, increasing at a **2.4% compound annual growth rate (CAGR) since 2000**.
- As a base load source of energy, geothermal is distinct from variable renewables, such as wind and solar, because **it can provide consistent electricity throughout the day and year**.
- Five Enhanced Geothermal System (EGS) technology multi-year demonstration projects were active in 2013.

# U.S. Geothermal Electricity Capacity and Generation

VI

	U.S. Geothermal Electricity Generation (GWh)	U.S. Geothermal Electricity Capacity and % Increase from Previous Year	
		Total (MW)	% Increase
2000	14,093	2,798	2.2%
2001	13,741	2,798	0.0%
2002	14,491	2,798	0.0%
2003	14,424	2,798	0.0%

VI

A wide-angle photograph of a vast agricultural field, likely a grain field, stretching to the horizon. The foreground is filled with rows of golden-brown grain, possibly sorghum or millet, with their heads clearly visible. The field is divided into sections by narrow paths or furrows. The sky above is a deep, clear blue, dotted with numerous white, fluffy cumulus clouds. The overall scene is bright and sunny, suggesting a clear day. A green horizontal bar is overlaid on the left side of the image, containing the text 'VII. Biopower' in white.

## VII. Biopower

# Biopower: Summary

- In 2013, biopower electricity generation accounted for **11% of all renewable energy generated in the United States**.
- Biopower electricity comes primarily from wood and agricultural residues that are burned as a fuel for cogeneration in the industrial sector (such as in the pulp and paper industry).
- U.S. installed biopower electricity capacity has grown recently, with a **compound annual growth rate (CAGR) of 3.8% from 2007 to 2013**.

# U.S. Biopower Electricity Capacity and Generation

VII

	U.S. Biopower Generation (GWh)	U.S. Biopower Capacity and % Change from Previous Year	
		Total (MW)	% Change
2000	60,726	10,676	- 2.9%

## VIII. Hydropower

# Hydropower: Summary

- Hydropower **capacity has remained essentially constant since 2000**, with less than a 2% total increase. Generation has fluctuated depending on water supply.
- Hydropower remains the largest source of renewable electricity generation, primarily large-scale hydropower, which **accounted for 6.6% of U.S. electricity generation in 2013**.
- Additional hydropower capacity was installed in the United States in 2013. However, generation from existing hydropower facilities has been declining since 2011.

A dramatic photograph of a large ocean wave curling over, creating a tunnel-like structure. The water is a deep, vibrant blue, and the foam is bright white. The sky is a pale, hazy blue. The wave is the central focus, with its crest curling back towards the viewer.

## IX. Advanced Water Power

# Advanced Water Power: Summary

- U.S. interest in advanced water power—such as **tidal, river, ocean current**, and **ocean wave** energy—continues to steadily grow with many prototype projects in testing stages and permits for production facilities being filed with the Federal Energy Regulatory Commission (FERC).
- There were no new tidal power project licenses issued by FERC in 2013. However, in September 2013, Ocean Renewable Power Company’s Tidal Energy Project became the first tidal power project to deliver power to an electric utility grid in the United States. More information may be found at these websites:
  - Federal Energy Regulatory Commission (FERC): [www.ferc.gov/industries/hydropower/gen-info/licensing/hydrokinetics.asp](http://www.ferc.gov/industries/hydropower/gen-info/licensing/hydrokinetics.asp)
  - The Water Power Program at the U.S. Department of Energy: [www1.eere.energy.gov/water](http://www1.eere.energy.gov/water)
  - The Ocean Energy Systems Implementing Agreement, established by the International Energy Agency: [www.ocean-energy-systems.org](http://www.ocean-energy-systems.org)
- Advanced water power development activity is concentrated in the North America and Europe.

X. Hydrogen and Fuel Cells

# Hydrogen and Fuel Cells: Summary

- The cumulative installed **global fuel cell capacity for stationary power increased by a factor of 3 between 2008 and 2013**, reaching approximately 150–160 MW in 2013.
- In 2013, **global electrical generation capacity from stationary fuel cells increased by nearly 25%** from the previous year.
- In 2013, **global fuel cell shipments increased approximately 25%** from the previous year.
- In 2013, **revenues from fuel cell systems shipped increased by more than 30%** over the previous year.
- In the United States, **nearly 9 million metric tons of hydrogen are produced today**, mostly serving the petroleum refining and chemicals industries; there are more than 1,500 miles of hydrogen pipelines.

X

## Hydrogen and Fuel Cells: Summary (continued)

- **The world's largest fuel cell power plant was opened in Hwasung City**, South Korea in 2013. The 59 MW facility will provide baseload power to the electricity grid and high-grade heat for district heating. Another fuel cell power generation plant (19.6 MW) is being planned for construction in Seoul City, South Korea.
- In the United States, a 15-MW fuel cell power park was completed in Bridgeport, Connecticut and is delivering baseload power to the electricity grid.
- Globally, more than 5,000 fuel cell units have been installed or ordered for backup power applications. These units have a successful startup rate greater than 99.7%.
- Globally, more than 8,200 fuel cells have been ordered or installed in forklifts.

## XI. Renewable and Alternative Fuels

# Renewable and Alternative Fuels: Summary

- **U.S. ethanol production totaled 13,300 million gallons** per year in 2013.\*
- Corn ethanol production—in contrast to Brazil’s ethanol, which is produced from sugar cane—has expanded rapidly in the United States. **Between 2000 and 2013, production increased by a factor of eight**, but has leveled off since 2010.\*\*
- In 2013, the United States\*\* produced 57% of the world’s ethanol, followed by Brazil at 27%, the European Union at 6%, China at 3%, and Canada at 2%.
- In 2013, the Indian River BioEnergy Center began producing cellulosic ethanol at commercial volumes for the first time. Several other cellulosic ethanol plants were under construction in 2013.\*\*\* In future years, at design capacity, these plants are expected to produce approximately 80 million gallons per year.
- In 2013, the number of **public and private electric vehicle charging stations was 9,214, with more than 22,000 charging outlets.**

XI

\*Most U.S. ethanol is currently produced from corn, but efforts are underway by the U.S. Department of Energy and others to study and commercialize cellulosic ethanol and biobased hydrocarbon fuels, which are produced from non-food crops.

Ethanol is blended with gasoline and generally comprises up to 10% of the fuel with gasoline as the other 90% (E10). Additionally, flex-fuel vehicles can use a blend of 85% ethanol and 15% gasoline (E85).

\*\*Constraints on corn ethanol production have included annual compliance targets established in the federal Renewable Fuels Standard (RFS); going forward, the current 10% ethanol limit in gasoline (blend wall) and the RFS advanced biofuel mandate are also expected to play a role (Source: EIA).

# Biodiesel: Summary

- **U.S. biodiesel production expanded to 1.8 billion gallons** (1.9 billion gasoline gallon equivalent) in 2013, a 63% increase from 2012.
- Biodiesel production in the United States in 2013 was **360 times what it was in 2001**.
- In 2013 the **United States led the world in biodiesel production**, followed by Germany, Brazil, Argentina, and France and Indonesia.
- **Worldwide, biodiesel production globally grew nearly 17%** from 2012 to 2013.

# U.S. Biodiesel Production and Price

	Biodiesel Price (gasoline gallon equivalent basis) (\$ per gallon)	Total U.S. Production (million gallons)
2001	1.80	5
2002	1.70	15
2003	1.80	20
2004	2.20	25
2005	3.40	75
2006	3.30	250
2007	3.40	450
2008	2.68	700
2009	3.28	545
2010	3.59	315
2011	3.88	1,100
2012	4.04	1,100
2013	3.92	1,800

XI

# Global Biodiesel Production

## Top Countries (2013) Biodiesel Production (millions of gallons/year)

Global Biodiesel Production (millions of gallons/year)	
2004	555
2005	1,030
2006	1,585
2007	2,378
2008	3,170
2009	4,385
2010	5,019
2011	5,653
2012	5,944
2013	6,948

**XII. Clean Energy Investments**

# Clean Energy Investment: Summary

- **Global new investments** in renewable energy have grown dramatically in the past decade, but have seen an 11% decrease since 2011, **with \$254 billion in new investments in 2013.**
- New investment in clean energy in the **U.S. totaled \$36.7 billion** in 2013.
- In 2013, solar experienced the highest levels of new investment, followed by wind.
- **Global venture capital and private equity** new investment in clean energy has increased from \$1.4 billion in 2004 to **\$4.4 billion in 2013.**

# Glossary

## Asset Financing (AF)

Using balance sheet assets (such as accounts receivable, short-term investments or inventory) to obtain a loan or borrow money - the borrower provides a security interest in the assets to the lender. This differs from traditional financing methods, such as issuing debt or equity securities, as the company simply pledges some of its assets in exchange for a quick cash loan.

## B2O

A fuel containing a mixture of 20% biodiesel and 80% petrodiesel.

## Baseload Capacity

The generating equipment normally operated to serve loads on an around-the-clock basis.

## Biodiesel

Any liquid biofuel suitable as a diesel fuel substitute or diesel fuel additive or extender. Biodiesel fuels are typically made from oils such as those derived from soybeans, rapeseed, or sunflowers; or from animal tallow. Biodiesel can also be made from hydrocarbons derived from agricultural products such as rice hulls.

## Biofuels

Liquid fuels and blending components produced from biomass (plant) feedstocks, used primarily for transportation.

## Biomass

Organic non-fossil material of biological origin.

## British Thermal Unit (Btu)

The quantity of heat required to increase the temperature of 1 pound of liquid water by 1 degree Fahrenheit at the temperature at which water has its greatest density (approximately 39 degrees Fahrenheit).

## Capacity Factor

The ratio of the electrical energy produced by a generating unit for a given period of time to the electrical energy that could have been produced at continuous full power operation during the same period.

## Compound Annual Growth Rate

The year-over-year growth rate applied during a multiple-year period. The formula for calculating CAGR is  $(\text{Current Value}/\text{Base Value})^{(1/\# \text{ of years})} - 1$ .

## Concentrating Solar Power (CSP)

A solar energy conversion system characterized by the optical concentration of solar rays through an arrangement of mirrors to heat working fluid to a high temperature. Concentrating solar power (but not solar thermal power) may also refer to a system that focuses solar rays on a photovoltaic cell to increase conversion efficiency.

# Glossary (continued)

## Digital Energy

The integration of digital communication technologies into energy systems, especially the electrical grid. Smart meters, along with other digital communication devices embedded in electrical transmission and distribution systems, allow for a two-way flow of information between utilities and their customers as well as greater digital control of the electrical grid, a concept known as the Smart Grid.

## E85

A fuel containing a mixture of 85% ethanol and 15% gasoline.

## Ethanol

A clear, colorless, flammable oxygenated hydrocarbon. Ethanol is typically produced chemically from ethylene, or biologically from fermentation of various sugars from carbohydrates found in agricultural crops and cellulosic residues from crops or wood. It is used in the United States as a gasoline octane enhancer and oxygenate (blended up to 10% concentration). Ethanol can also be used in high concentrations (E85) in vehicles designed for its use.

## Federal Energy Regulatory Commission (FERC)

The federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, some natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy (DOE) and is the successor to the Federal Power Commission

## Flexible-Fuel Vehicles

Vehicles that can operate on (1) alternative fuels (such as E85); (2) 100% petroleum-based fuels; (3) any mixture of an alternative fuel (or fuels) and a petroleum-based fuel. Flexible-fuel vehicles have a single fuel system to handle alternative and petroleum-based fuels.

## Fuel Cell

A device that produces electricity by converting the chemical energy of a fuel (e.g., hydrogen) directly into electrical energy. Fuel cells differ from conventional electrical cells in that the active materials such as fuel and oxygen are not contained within the cell but are supplied from outside. It does not contain an intermediate heat cycle as do most other electrical generation techniques.

# Glossary (continued)

## Gasoline Gallon Equivalent (GGE)

The amount of alternative fuel it takes to equal the energy content of one liquid gallon of gasoline. GGE allows consumers to compare the energy content of competing fuels against a commonly known fuel—gasoline.

## Generation

The total amount of electric energy produced by generating units and measured at the generating terminal in kilowatt-hours (kWh) or megawatt-hours (MWh).

## Ground Source (Geothermal) Energy

The heat that is extracted from hot water or steam that is mined from geothermal reservoirs in the Earth's crust. Water or steam can be used as a working fluid for geothermal heat pumps, water heating, or electricity generation, and then is injected back into the Earth.

## Geothermal Heat Pump

A heat pump in which the refrigerant exchanges heat (in a heat exchanger) with a fluid circulating through an earth connection medium (ground or ground water). The fluid is contained in a variety of loop (pipe) configurations depending on the temperature of the ground and the ground area available. Loops may be installed horizontally or vertically in the ground or submersed in a body of water.

## Gigawatt (GW)

One billion watts or one thousand megawatts or one million kW.

## Gigawatt-hour (GWh)

One billion watt-hours.

## Incremental Capacity

Capacity added on an annual basis.

## Insolation

The amount of radiation from the sun received at the surface of the Earth in a particular geographic location or region.

## Kilowatt (kW)

One thousand watts.

## Kilowatt-hour (kWh)

A measure of electrical energy defined as a unit of work or energy, measured as 1 kilowatt (1,000 watts) of power expended for 1 hour. One kWh is equivalent to 3,412 Btu.

## Landfill Gas

Gas that is generated by decomposition of organic material at landfill disposal sites. The average composition of landfill gas is approximately 50% methane and 50% carbon dioxide and water vapor by volume. The methane in landfill gas may be vented, flared, or combusted to generate electricity or useful thermal energy on-site, or injected into a pipeline for combustion off site.

## Megawatt (MW)

One million watts of electricity.

## Megawatt-hour (MWh)

One thousand kilowatt-hours or 1 million watt-hours.

# Glossary (continued)

## Mergers and Acquisitions (M&A)

A general term used to refer to the consolidation of companies. A merger is a combination of two companies to form a new company, while an acquisition is the purchase of one company by another in which no new company is formed.

## Municipal Solid Waste (MSW)

Residential solid waste and some nonhazardous commercial, institutional, and industrial wastes.

## Nameplate Capacity

The maximum rated output of a generator under specific conditions designated by the manufacturer. Nameplate capacity is usually indicated in units of kilovolt-amperes (kVA) and in kilowatts (kW) on a nameplate physically attached to the generator.

## Ocean Energy

Energy conversion technologies that harness the energy in tides, waves, and thermal gradients in the oceans.

## Photovoltaic (PV) Cell

PV cells convert incident light directly into electricity (direct current). An electronic device consisting of layers of semiconductor materials fabricated to form a junction (adjacent layers of materials with different electronic characteristics) and electrical contacts.

## Private Equity (PE)

Equity capital that is not quoted on a public exchange. Private equity consists of investors and funds that make investments directly into private companies or conduct buyouts of public companies that result in a delisting of public equity. Capital for private equity is raised from retail and institutional investors, and can be used to fund new technologies, expand working capital within an owned company, make acquisitions, or to strengthen a balance sheet.

## Pumped-Storage Hydroelectric Plant

A plant that usually generates electric energy during peak load periods by using water previously pumped into an elevated storage reservoir during off-peak periods when excess generating capacity is available to do so.

## Renewable Energy Resources

Energy resources that are naturally replenishing but flow-limited. They are virtually inexhaustible in duration but limited in the amount of energy that is available per unit of time. Renewable energy resources include biomass, hydropower, geothermal, solar, wind, and ocean energy.

# Glossary (continued)

## Solar Thermal Collector

A device designed to receive solar radiation and convert it to thermal energy. Normally, a solar thermal collector includes a frame, glazing, and an absorber, together with appropriate insulation. The heat collected by the solar collector may be used immediately or stored for later use. Solar collectors are used for space heating; domestic hot water heating; and heating swimming pools, hot tubs, or spas.

## Thermoelectric Power Plant

A term used to identify a type of electric generating station, capacity, capability, or output in which the source of energy for the prime mover is heat.

## Venture Capital (VC)

Money provided by investors to startup firms and small businesses with perceived long-term growth potential. This is a very important source of funding for startups that do not have access to capital markets. It typically entails high risk for the investor, but it has the potential for above-average returns.

## Wind Energy

Kinetic energy present in wind motion that can be converted to mechanical energy for driving pumps, mills, and electric power generators.
